

Hit The Road Jackpot - Token System Framework

This document explains the token-based system for Hit The Road Jackpot. The system is designed to keep gameplay engaging, transparent, and legally compliant with sweepstakes regulations.

1. Token Pricing

- Players purchase tokens at fixed rates. Example: \$5 = 20 tokens.
- The pricing structure can be scaled up (e.g., \$10 = 40 tokens, \$25 = 100 tokens).

2. Game Costs

- Each game requires a set number of tokens to enter (e.g., 10 tokens).
- The operator can adjust how many tokens a game costs.
- The operator can also set how many tokens in total are required before a winner is announced. For example, a game may require the equivalent of \$1,000 in tokens before closing.

3. Game Progress Meter

- Each game has a digital meter that shows how many tokens have been entered versus how many are required.
- Example: A \$1,000 game requiring 4,000 tokens will show progress (e.g., 2,500/4,000 tokens filled).
- Once the target is reached, the game closes, and a winner is generated.

4. Spinner and Randomization

- When a player uses tokens to enter, the system generates a unique entry number tied to that player.
- The digital spinner uses a secure random number generator to assign numbers and ensure fairness.
- All numbers are tracked and stored until the game concludes.
- Once the required token threshold is met, the spinner randomly selects one of the issued numbers as the winner.

5. Legal and Compliance Considerations

- To stay federally compliant, a 'No Purchase Necessary' (NPN) entry option must be available.
- Tokens serve as a game currency but do not guarantee winning—only a chance to play.
- The system must ensure fairness, transparency, and proper disclosure of rules and odds.

6. No Purchase Necessary (NPN) Entry

To comply with sweepstakes laws, players must have a way to participate without making a purchase. This is where the NPN entry comes in.

- Each player is allowed to use the NPN option only ONCE per game.
- The NPN entry gives the player the same chance to win as if they used paid tokens.
- Once a player has used their free entry for a game, the system prevents them from using it again for that same game.
- This keeps the system fair and avoids abuse of the free-entry option.
- The NPN button will clearly state 'One Free Entry Per Game – No Purchase Necessary.'

7. Example Game Setup

Game	Token Cost per Entry	Total Tokens Required	Cash Equivalent Goal	NPN Allowed
Game A	10 Tokens	4,000 Tokens	\$1,000	Yes – Once per player
Game B	5 Tokens	10,000 Tokens	\$2,500	Yes – Once per player

Prize Plugz - Token Game Logic Framework

This framework explains how Prize Plugz uses a token-based game system. Unlike sweepstakes, Prize Plugz is designed as a digital arcade where tokens are credits to play games. Players use tokens to participate in interactive games that feature prizes, community-driven progress meters, and transparent randomization mechanics.

1. Tokens as Game Credits

- Tokens are purchased as credits to play games. Example: \$5 = 20 tokens.
- Tokens are not 'entries' into a raffle, but credits used within games (like arcade tokens).
- Each game defines how many tokens are required per play (e.g., 5 tokens per spin).

2. Game Mechanics

- Each game has a prize pool goal, represented as a progress meter.
- Players spend tokens to play, which contributes toward filling the prize meter.
- Once the meter is filled (e.g., \$1,000 worth of tokens), the game closes.
- The random number generator (RNG) selects a winner from the pool of issued numbers tied to each play.
- All plays are tracked until the game ends, ensuring fairness and transparency.

3. Free Daily Play

- To enhance fairness and accessibility, players receive one free play per game.
- This free play is equivalent to a token-based entry but does not cost money.
- The system limits each player to one free play per game, preventing abuse.
- This free play functions as a 'daily free spin' mechanic commonly found in mobile games.

4. Randomization and Fairness

- Every token play generates a unique entry number tied to the player.
- RNG ensures all numbers have equal chance of being selected.
- Once the prize meter is filled, RNG selects the winning number.
- Transparency: players can see the progress bar and their numbers assigned in real time.

5. Example Games

Example 1: Golden Spinner

- Cost: 10 tokens per spin
- Prize Pool Goal: \$1,000 (4,000 tokens)
- Game Flow: Each spin animates a digital wheel. Numbers are assigned to players as they spin. When the \$1,000 goal is reached, the wheel randomly selects a winning number from all assigned entries.

Example 2: Treasure Chest Unlock

• Cost: 5 tokens per unlock attempt • Prize Pool Goal: \$500 (2,000 tokens) • Game Flow: Players use tokens to try unlocking a chest. Each attempt contributes toward filling the chest's prize meter. Once the meter is filled, the chest opens and RNG selects one of the attempts as the prize winner.

Example 3: Community Boss Battle

• Cost: 20 tokens per attack • Prize Pool Goal: \$2,000 (8,000 tokens) • Game Flow: A digital boss with a health bar must be defeated by the community. Each token attack reduces the boss's health. When the health reaches zero (meter full), the boss is defeated and RNG selects one of the contributing players as the prize winner.

6. Legal and Compliance Positioning

• Prize Plugz operates as a gaming platform, not a sweepstakes. • Tokens are game credits, not raffle entries. • Free daily plays exist as a game mechanic, not just a legal obligation. • RNG and transparent progress meters ensure fairness. • This positions Prize Plugz closer to digital arcade/gacha mechanics rather than sweepstakes, reducing legal risk while maintaining excitement.
